< 40	F	Fail	0
Absent	N	Absent	0
<b>For Mandatory Courses</b>			
≥40	P	Satisfactory	-
<40	I	Not Satisfactory	-
<b>For NCC/NSS Activities</b>

$$CGPA = \frac{\sum (C \times GP)}{\sum C}$$

Where, C denotes the credits assigned to courses undertaken up to the end of the Program and GP denotes the grade points earned by the student in the respective courses.

Both SGPA and CGPA shall be rounded off to 2 decimal points and reported in the transcripts.

As per AICTE regulations, conversion of CGPA into equivalent percentage as follows:

$$\text{Equivalent Percentage} = (\text{CGPA} - 0.50) \times 10$$

  - b) Write a program to input n integers and perform sorting between them.

##### RECURSIVE FUNCTIONS AND OVERLOADING:

2.
  - a) The Fibonacci sequence is defined by the following rule. The first 2 values in the sequence are 0, 1. Every subsequent value is the sum of the 2 values preceding it. Write a Java program that uses both recursive and non-recursive functions to print the nth value of the Fibonacci sequence?
  - b) Write and test overloaded methods to find sum of three integers, sum of three double values and sum of four integers.
  - c) Write a program to define a class student with name, registration number and marks for three subjects as instance variables and describe a constructor to initialize them. Also define a method display to print all the values.

After performing the operation, the program should ask the user if he wants to continue. If the user presses y or Y, then the program should continue displaying the menu else the program should terminate. [Use Scanner class].

- b) Write a program to create an abstract class named Shape that contains an empty method named numberOfSides ( ). The division of Num1 and Num2 is displayed in the Result field when the Divide button is clicked. If Num1 or Num2 were not an integer, the program would throw a Number Format Exception. If Num2 were Zero, the program would throw an Arithmetic Exception Display the exception in a message dialog box.

#### **INTERACTIVE DRIVER CLASS:**

6. A University awards some grace marks to students who participate in the Inter University games. Therefore, total marks awarded = Exam\_Marks +Sports\_Grace\_Marks. If total marks scored are greater than maximum marks, then the final marks awarded will be equal to the maximum marks. An Object Oriented based implementation will contain a class called Results, which extends a class called Exam, which itself extends a class called Student. - CO2.** Apply design principles of UML for software design.
- CO3.** Apply tools for developing UML diagrams.
- CO4.** Use cost estimation models for project evaluation.

**LIST OF CASE STUDIES:**

Case studies given below should be Modeled using Visual Modeling tools in different views i.e. Use case view, logical view, component view, Deployment view.

**CASE STUDY 1: ONLINE TICKET RESERVATION FOR RAILWAYS**

**Problem Statement:** Computer play an integral part of the day in today's life. It makes the entire job easier and faster, every job is computerized so as the ticket reservation we can book over the online ticket reservation system. During the booking of the ticket reservation passenger has to select origin, date of journey, destination, class of train etc. The reservation counter keeps track of passenger's information. Thus the system will have all the details about the trains and facilities provided by them. There are various trains with the different level of convenience for the passengers. The whole database will be maintained by database administrator. There are varieties of trains where the passengers can select the train according to the convenience for their destination journey. The journey could be within the state or across the India. Each train has the three types of classes i.e. Sleeper class, First class and the AC compartment. Design the application for the above problem description.

**CASE STUDY 2: A POINT OF SALE (POS) SYSTEM**

**Problem Statement:** A POS System is a computerized application used to record sales and handle payments; it is typically used in a retail store. It includes hardware components such as a computer and bar code scanner, and software to run the system. It interfaces to various service applications, such as a third-party tax calculator and inventory control. These systems must be relatively fault tolerant; that is, even if remote services and temporarily unavailable they must still be of capturing sales and handling at least cash payments. A POS system must support multiple and varied client – side terminals and interfaces such as browser, PDA's, touch – screens.

**CASE STUDY 3: RECRUITMENT PROCEDURE FOR SOFTWARE INDUSTRY**

**Problem Statement:** In the software industry the recruitment procedure is the basic thing that goes in the hand with the requirement as specified by the technical management team. HR first gives an advertisement in leading Newspapers, Journals, Weeklies and Websites. The job seekers can apply for it through by Post or by e-mail to the company. The technical skill and the experience of the candidates are reviewed and

the short listed candidates are called for the interview. There may be different rounds for interview like the written test, technical interview, and HR interview. After the successful completion of all rounds of interview, the selected candidates' names are displayed. Meanwhile HR gives all the details about the salary, working hours, terms and conditions and the retirement benefit to the candidate.

#### **CASE STUDY 4: ONLINE AUCTION SALES**

**Problem Statement:** The online auction system is a design about a website where sellers collect and prepare a list of items they want to sell and place it on the website for visualizing. To accomplish this purpose the user has to access the site. In case it's a new user he has to register. Purchaser's login and select items they want to buy and keep bidding for it. Interacting with the purchasers and sellers through messages does this. There is no need for customer to interact with the sellers because every time the purchasers bid, the details will be updated in the database. The purchaser making the highest bid for an item before the close of the auction is declared as the owner of the item. If the auctioneer or the purchaser doesn't want to bid for the product then there is fixed cutoff price mentioned for every product. He can pay that amount directly and own the product. The purchaser gets a confirmation of his purchase as an acknowledgement from the website. After the transaction by going back to the main menu where he can view other items.

#### **CASE STUDY 5: TWO FLOOR ELEVATOR SIMULATOR**

**Problem Statement:** The elevator has the basic function that all elevator systems have, such as moving up and down, open and close doors, and of course, pick up passengers. The elevator is supposed to be used in a building having floors numbered from 1 to MaxFloor, where the first floor is the lobby. There are car call buttons in the car corresponding to each floor. For every floor except for the top floor and the lobby, there are two hall call buttons for the passengers to call for going up and down. There is only one down hall call button at the top floor and one up hall call button in the lobby. When the car stops at a floor, the doors are opened and the car lantern indicating the current direction the car is going is illuminated so that the passengers can get to know the current moving direction of the car. The car moves fast between floors, but it should be able to slow down early enough to stop at a desired floor. When an elevator has no requests, it remains at its current floor with its doors closed.

In order to certificate system safety, emergency brake will be triggered and the car will be forced to stop under any unsafe conditions.

#### **CASE STUDY 6: HOME APPLIANCE CONTROL SYSTEM**

**Problem Statement:** A home appliance control system (HACS) is a system which provides various services to remotely operate on home appliances, such as microwave oven, TV, and garage door etc through remote devices such as mobile phone, desktop and palm-top. A home appliance control system (HACS) is a system which is controlled by a remote system such as a mobile phone or a palm-top, and at the same time controls, monitors and coordinates home appliances such as air conditioner, microwave oven, garage doors, TV set, VCR, audio controller, indoor/outdoor lights, water sprinkler, home security system, bath tub controller, etc. In order to activate home appliances and to allow for different ways of cooking, the HACS needs mechanisms for communication between the different devices in the system, and for coordination among the various processes running on such devices. The system administrator of the HACS system has the ability to add a new appliance or delete an existing one. The system administrator has the ability to add a new remote device and configure it with HACS or delete an existing one when it is not used. Also the system administrator can create an account for a new user or delete existing account if it is no longer used.

  2. Geometric distribution
  3. Poisson distribution
  4. Uniform distribution

3. Simulate the Random variates following
  1. Erlangs distribution
  2. Gamma distribution
  3. Weibull distribution
  4. Beta distribution
  5. Triangular distribution
4. A production process manufactures computer chips on the average at 2% nonconforming. Every day, a random sample of size 50 is taken from the process. If the sample contains more than two nonconforming chips, the process will be stopped. Simulate the process to compute the probability that the process is stopped by the sampling scheme.
5. A computer repair person is "beeped" each time there is a call for service. The number of beeps per hour is known to occur in accordance with a Poisson distribution with a mean of  $x = 2$  per hour. Simulate the process to find the probability of two or more beeps in a 1-hour period.
6. A bus arrives every 20 minutes at a specified stop beginning at 6:40 A.M. and continuing until 8:40 A.M. A certain passenger does not know the schedule, but arrives randomly between 7:00A.M. and 7:30 A.M. every morning. Simulate the process to compute the probability that the passenger waits more than 5 minutes for a bus? ·
7. Consider a single-server queue with Poisson arrivals at an average rate of one per every 10 minutes and service times that are normally distributed, with mean of 9.75 minutes and standard deviation of 1.75 minute. This is an M/G/ 1 queue with long run utilization is 0.95. Suppose that a total of 10 independent replications. The total simulation run length on each replication was 15,000 minutes. The response variable was queue length,  $LQ(t, r)$ , at time  $t$ , where the second argument,  $r$ , denotes the replication ( $r = 1, \dots, 10$ ). The raw output data

were hatched, as in intervals of 1000 minutes. Assume data for each replication and 15 batches for each replication. Conduct output analysis for steady state simulation.

8. Five numbers 0.44, 0.81, 0.14, 0.05, 0.93 were generated, and it is desired to perform a test for uniformity by using the Kolmogorov-Smirnov test with the level of significance.  $\alpha = 0.05$ .
9. Records pertaining to the monthly number of job-related injuries at an underground coal mine were being studied by a federal agency. The values for the past six months were as follows:

Injuries per month	Frequency of occurrence
0	35
1	40
2	13
3	6
4	4
5	1
6	1

- a. Apply chi-square test to these data to test the hypothesis that the underlying distribution is poison. Use the level of significance  $\alpha = 0.05$ .
  - b. Apply chi-square test to these data to test the hypothesis that the distribution is poison with mean 1.0. Again, let  $\alpha = 0.05$ .
  - c. What are the differences between parts (a) and (b), and when might each case arise?
10. The union Bank opens at 10:00 A.M. (time 0) with no customers present and 4 of the 9 tellers working (initial conditions) and closes at 4:00 P.M. (time  $T = 300$  minutes). Here the event E is merely the fact that the bank has been open for 300 minutes. Develop a simulation model for the interaction between customers and tellers over the entire day, including the effect of starting up and of closing down at the end of the day.
